

Neurosis

Neurosis is a class of [functional mental disorders](#) involving chronic [distress](#), but neither [delusions](#) nor [hallucinations](#). The term is no longer used by the professional [psychiatric community](#) in the United States, having been eliminated from the *Diagnostic and Statistical Manual of Mental Disorders* (DSM) in 1980 with the publication of [DSM III](#). However, it is still used in the [ICD-10](#) Chapter V F40–48.

	Neurosis
Other names	Psychoneurosis, neurotic disorder
Specialty	Psychiatry , clinical psychology

Neurosis should not be mistaken for [psychosis](#), which refers to a loss of touch with reality. Nor should it be mistaken for [neuroticism](#), a fundamental [personality trait](#) proposed in the [Big Five personality traits](#) theory.

Etymology

The term is derived from the Greek word *neuron* (νεῦρον, 'nerve') and the suffix *-osis* (-ωσις, 'diseased' or 'abnormal condition').

The term *neurosis* was coined by Scottish doctor [William Cullen](#) in 1769 to refer to "disorders of sense and motion" caused by a "general affection of the [nervous system](#)." Cullen used the term to describe various nervous disorders and symptoms that could not be explained

[physiologically](#). Physical features, however, were almost inevitably present, and physical diagnostic tests, such as exaggerated [knee-jerks](#), loss of the [gag reflex](#) and [dermatographia](#), were used into the 20th century.^[1] The meaning of the term was redefined by [Carl Jung](#) and [Sigmund Freud](#) over the early and middle 20th century, and has continued to be used in psychology and philosophy.^{[2][3]}

The *Diagnostic and Statistical Manual of Mental Disorders* (DSM) eliminated the *neurosis* category in 1980, because of a decision by its editors to provide descriptions of behavior rather than descriptions of hidden psychological mechanisms.^[4] This change has been controversial.^[5] Likewise, according to the *American Heritage Medical Dictionary*, *neurosis* is "no longer used in psychiatric diagnosis."^[6]

Symptoms and causes

Neurosis may be defined simply as a "poor ability to adapt to one's environment, an inability to change one's life patterns, and the inability to develop a richer, more complex, more satisfying personality."^[7] There are many different neuroses, including:

- [obsessive–compulsive disorder](#)
- [obsessive–compulsive personality disorder](#)
- [impulse control disorder](#)
- [anxiety disorder](#)
- [histrionic personality disorder](#)
- [dissociative disorder](#)
- a great variety of [phobias](#)

According to [C. George Boeree](#), professor emeritus at [Shippensburg University](#), the symptoms of neurosis may involve:^[7]

... anxiety, sadness or depression, anger, irritability, mental confusion, low sense of self-worth, etc., behavioral symptoms such as phobic avoidance, vigilance, impulsive and compulsive acts, lethargy, etc., cognitive problems such as unpleasant or disturbing thoughts, repetition of thoughts and obsession, habitual fantasizing, negativity and cynicism, etc. Interpersonally, neurosis involves dependency,

aggressiveness, perfectionism, schizoid isolation, socio-culturally inappropriate behaviors, etc.

Jungian theory

Carl Jung found his approach particularly effective for patients who are well adjusted by social standards but are troubled by [existential questions](#). Jung claims to have "frequently seen people become neurotic when they content themselves with inadequate or wrong answers to the questions of life".^{[8]:140} Accordingly, the majority of his patients "consisted not of believers but of those who had lost their faith".^{[8]:140} A contemporary person, according to Jung,

...is blind to the fact that, with all his rationality and efficiency, he is possessed by 'powers' that are beyond his control. His gods and demons have not disappeared at all; they have merely got new names. They keep him on the run with restlessness, vague apprehensions, psychological complications, an insatiable need for pills, alcohol, tobacco, food — and, above all, a large array of neuroses.^{[9]:82}

Jung found that the [unconscious](#) finds expression primarily through an individual's inferior psychological function, whether it is thinking, feeling, sensation, or intuition. The characteristic effects of a neurosis on the dominant and inferior functions are discussed in his [Psychological Types](#). Jung also found collective neuroses in [politics](#): "Our world is, so to speak, dissociated like a neurotic."^{[9]:85}

Psychoanalytic theory

According to [psychoanalytic theory](#), neuroses may be rooted in ego [defense mechanisms](#), though the two concepts are not synonymous. Defense mechanisms are a normal way of developing and maintaining a consistent [sense of self](#) (i.e., an [ego](#)). However, only those thoughts and behaviors that produce difficulties in one's life should be called *neuroses*.

A neurotic person experiences emotional distress and [unconscious conflict](#), which are manifested in various physical or mental illnesses; the definitive symptom being [anxiety](#). Neurotic tendencies are common and may manifest themselves as acute or chronic anxiety, [depression](#), an [obsessive–compulsive disorder](#), a [phobia](#), or a [personality disorder](#).

Horney's theory

In her final book, *Neurosis and Human Growth*, Karen Horney lays out a complete theory of the origin and dynamics of neurosis.^[10] In her theory, neurosis is a distorted way of looking at the world and at oneself, which is determined by compulsive needs rather than by a genuine interest in the world as it is. Horney proposes that neurosis is transmitted to a child from their early environment and that there are many ways in which this can occur.^{[10]:18}

When summarized, they all boil down to the fact that the people in the environment are too wrapped up in their own neuroses to be able to love the child, or even to conceive of him as the particular individual he is; their attitudes toward him are determined by their own neurotic needs and responses.

The child's initial reality is then distorted by their parents' needs and pretenses. Growing up with neurotic caretakers, the child quickly becomes insecure and develops *basic anxiety*. To deal with this anxiety, the child's imagination creates an idealized *self-image*.^{[10]:22}

Each person builds up his personal idealized image from the materials of his own special experiences, his earlier fantasies, his particular needs, and also his given faculties. If it were not for the personal character of the image, he would not attain a feeling of identity and unity. He idealizes, to begin with, his particular "solution" of his basic conflict: compliance becomes goodness, love, saintliness; aggressiveness becomes strength, leadership, heroism, omnipotence; aloofness becomes wisdom, self-sufficiency, independence. What—according to his particular solution—appear as shortcomings or flaws are always dimmed out or retouched.

Once they identify themselves with their idealized image, a number of effects follow. They will make claims on others and on life based on the prestige they feel entitled to because of their idealized self-image. They will impose a rigorous set of standards upon themselves in order to try to measure up to that image. They will cultivate *pride*, and with that will come the vulnerabilities associated with pride that lacks any foundation. Finally, they will despise themselves for all their limitations. *Vicious circles* will operate to strengthen all of these effects.

Eventually, as they grow to adulthood, a particular "solution" to all the inner conflicts and vulnerabilities will solidify. They will be either

- expansive, displaying symptoms of [narcissism](#), [perfectionism](#), or vindictiveness
- [self-effacing](#) and compulsively compliant, displaying symptoms of neediness or codependence
- resigned, displaying [schizoid](#) tendencies

In Horney's view, mild anxiety disorders and full-blown [personality disorders](#) all fall under her basic scheme of neurosis as variations in the degree of severity and in the individual dynamics. The opposite of neurosis is a condition Horney calls [self-realization](#), a state of being in which the person responds to the world with the full depth of their spontaneous feelings, rather than with anxiety-driven compulsion. Thus the person grows to actualize their inborn potentialities. Horney compares this process to an acorn that grows and becomes a tree: the acorn has had the potential for a tree inside it all along.
