

Global System for Mobile Communication (GSM)

Li-Hsing Yen
Assistant Prof.
Dept. of CSIE, Chung Hua Univ.

GSM System Architecture

Nomenclature

- MS (Mobile Station) =
MT (Mobile Terminal) +
TE (Terminal Equipment)
- BSS (Base Station Subsystem) =
BTS (Base Transceiver Station) +
BSC (Base Station Controller)
- NSS (Network Switching Subsystem)
- MSC (Mobile Switching Center): telephony
switching function and authentication of user

HLR and VLR

- **HLR** (Home Location Register)
 - a database to store and management **permanent** data of subscribers
- **VLR** (Visitor Location Register)
 - a database to store **temporary** information about subscribers
 - needed by MSC in order to service visiting subscribers

AuC and EIR

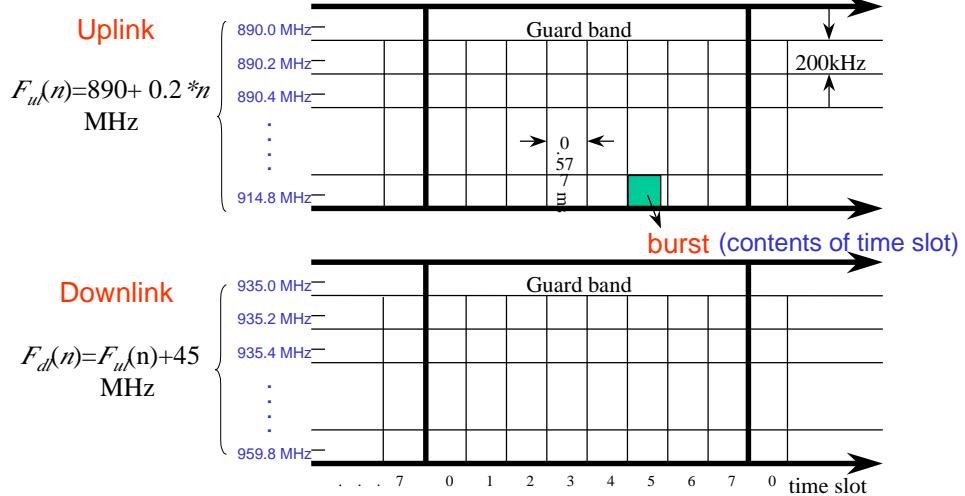

- Authentication Center ([AuC](#))
 - used in the security data management for the authentication of subscribers.
- Equipment Identity Register ([EIR](#))
 - used to maintain a list of legitimate, fraudulent, or faulty MSs.
 - optional in GSM network, and is not used generally.

GSM Interfaces

- U_m
 - Radio interface between MS and BTS
 - each physical channel supports a number of logical channels
- A_{bis}
 - between BTS and BSC (vender specific)
 - primary functions: traffic channel transmission, terrestrial channel management, and radio channel management

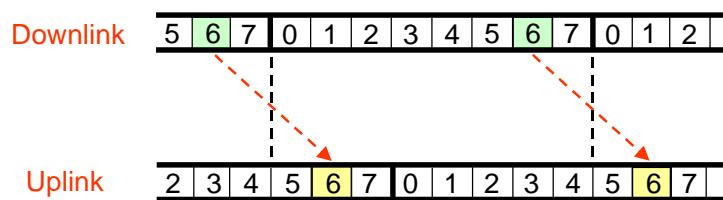

Frequency Division Duplex

n : Absolute Radio Frequency Channel Number (ARFCN). $1 \leq n \leq 124$

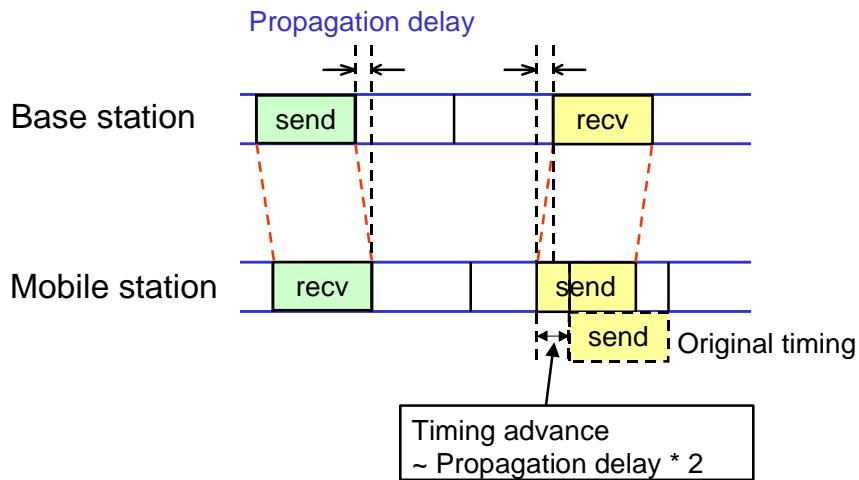

Time Division Duplex

MS and BTS do not transmit simultaneously
(MS transmits 3 time slots after the BTS)

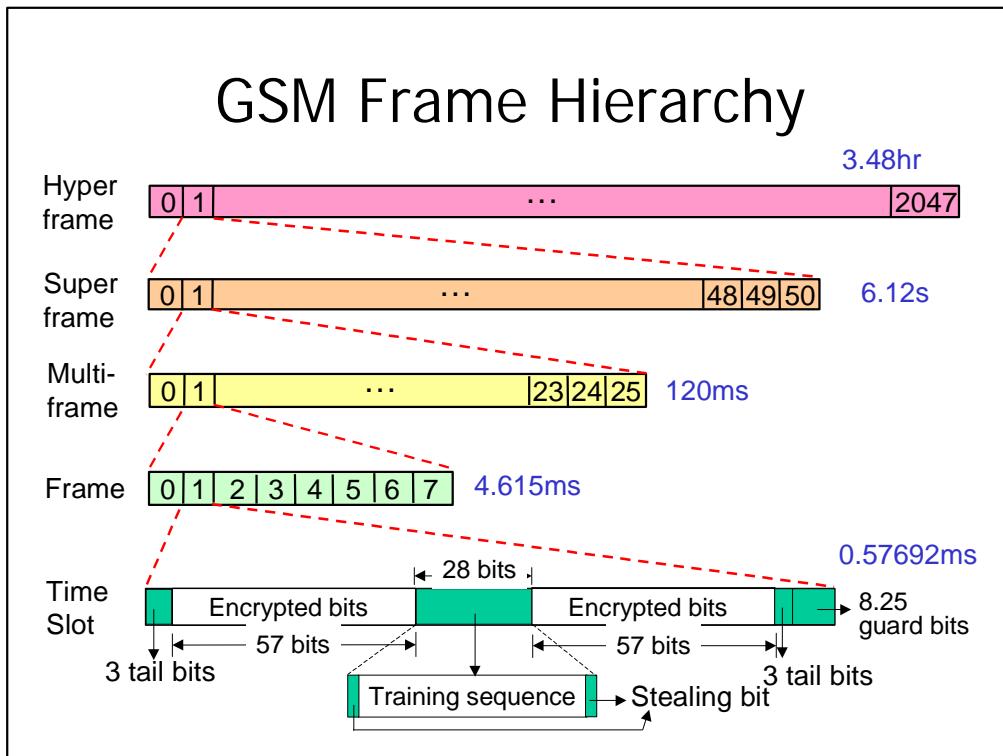

Timing advance: MS transmits its data a little earlier as demanded by the “three time slots delay rule”.

Timing Advance

GSM Frame Structure

- 1 hyperframe = 2048 superframes (~3.5hr)
- For speech
 - 1 superframe = 51 multiframe = 6.12s
 - 1 multiframe = 26 frames = 120ms
- For Signaling
 - 1 superframe = 26 multiframe
 - 1 multiframe = 51 frames
- 1 frame = 8 time slots = 4.615 ms
- 1 time slot = 156.25 bit duration = 0.577ms

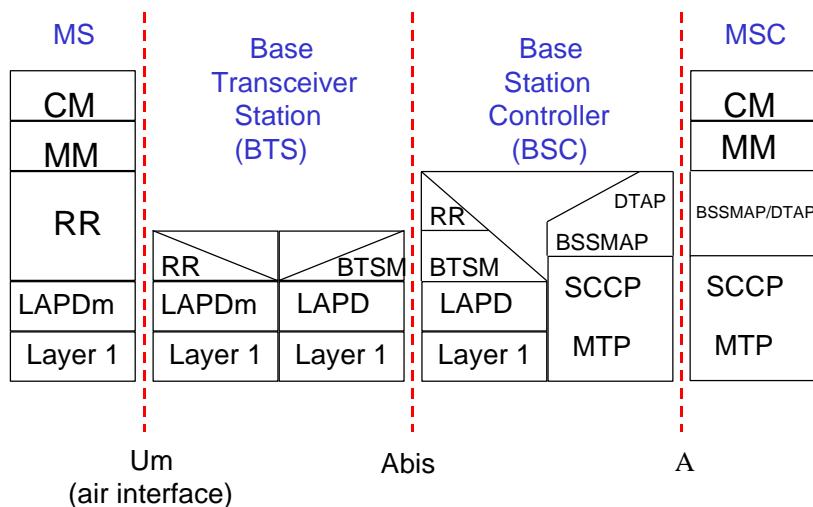

Normal Burst Format

- **Trail bits**
 - always (0,0,0); provide start and stop bit pattern
- **encrypted bits**
 - data is encrypted
- **stealing bits**
 - indicate whether the burst was stolen for urgent control signaling (FACCH signaling)
- **Guard bits**
 - avoid overlapping with other bursts due to different path delay

Training Sequence

- A known bit pattern that differs for different adjacent cells
- to adapt the parameters of the receiver to the current path propagation characteristics
- to select the strongest signal in case of multipath propagation
- for multipath equalization
 - extract the desired signal from unwanted reflections

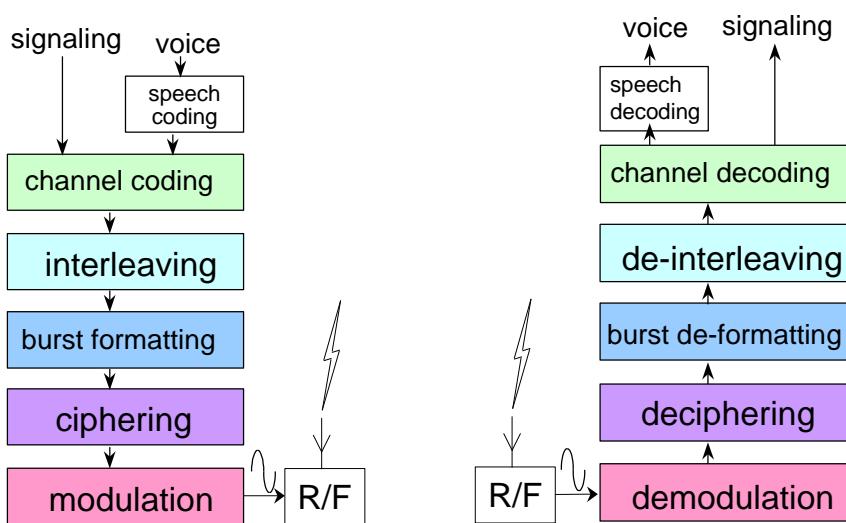

GSM Protocol Stack

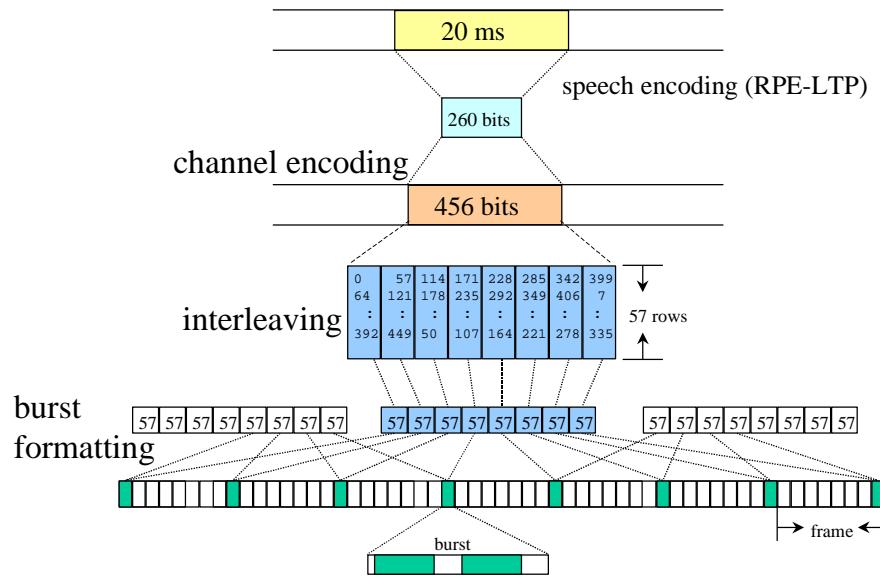

Layer 1 - Physical Layer

- Modulation
- Equalization
- Channel coding
 - block code
 - convolutional code
- Interleaving
 - to distribute burst error

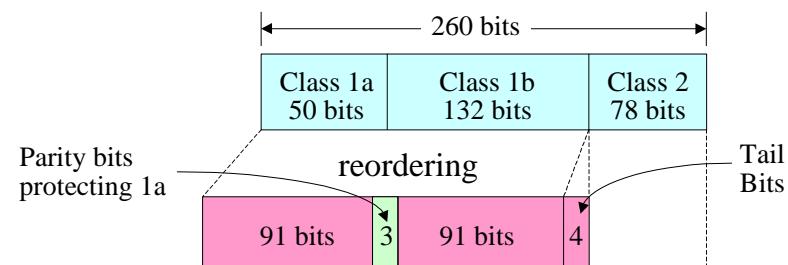

GSM Physical Layer (MS Side)

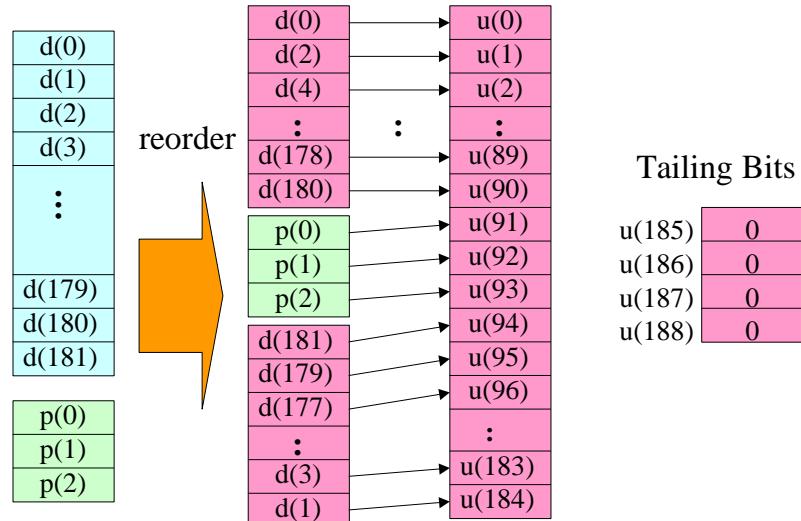

GSM Speech Transmission

GSM Speech Channel Coding

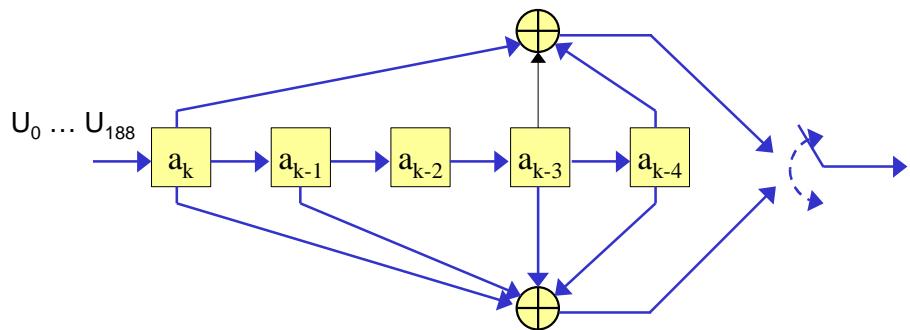

Tailing Bits and Reordering

Parity Bits

- The first 50 bits are protected by 3 parity bits $p(0), p(2), p(3)$
- generator polynomial $g(D)=D^3+D+1$
- the remainder of $d(0)D^{52}+d(1)D^{51}+\dots+d(49)D^3+p(0)D^2+p(1)D+p(2)$ divided by $g(D)$ should be $1+D+D^2$

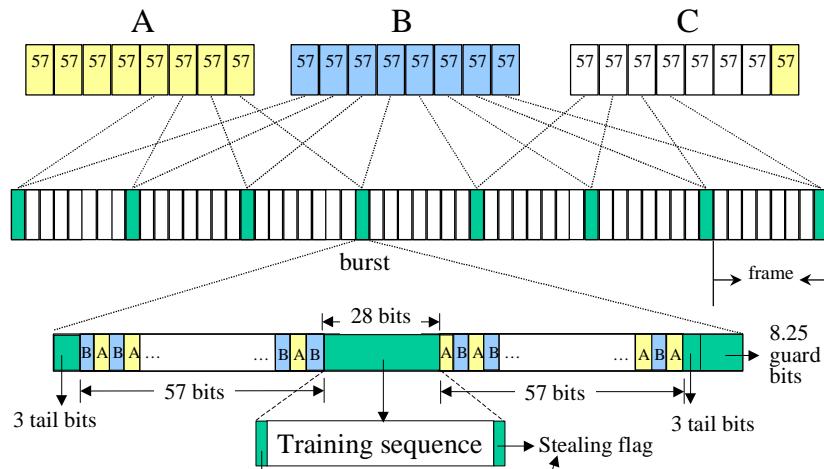

Convolutional Encoder for GSM Speech (Rate=1/2, K=5)

Interleaving

0	57	114	171	228	285	342	399

GSM Normal Burst Formatting

Physical Vs. Logical Channels

- Physical channels are all the available time slots of a BTS
 - a BTS with 6 carriers has 48 physical channels
- Logical channels are piggybacked on the physical channels
 - logical channels are laid over the grid of physical channels
 - each logical channel performs a specific task

GSM Logical Channels (I)

- Speech traffic channels (TCH)
 - Full-rate TCH (TCH/F)
 - Half-rate TCH (TCH/H)
- Broadcast channels (BCH)
 - Frequency correction channel (FCCH)
 - Synchronization channel (SCH)
 - Broadcast control channel (BCCH)
- Cell broadcast channel (CBCH)

GSM Logical Channels (II)

- Common control channels (CCCH)
 - Paging channel (PCH)
 - Access grant channel (AGCH)
 - Random access channel (RACH)
- Dedicated control channel (DCCH)
 - Slow associated control channel (SACCH)
 - Stand-alone dedicated control channel (SDCCH)
 - Fast associated control channel (FACCH)

Broadcast Channels (BCH)

- Frequency correction channel (FCCH)
 - the “lighthouse” of a BTS
- Synchronization channel (SCH)
 - PLMN/base identifier of a BTS plus synchronization information (frame number)
- Broadcast control channel (BCCH)
 - to transmit system information 1-4, 7-8 (differs in GSM 900, GSM 1800, and PCS 1900)

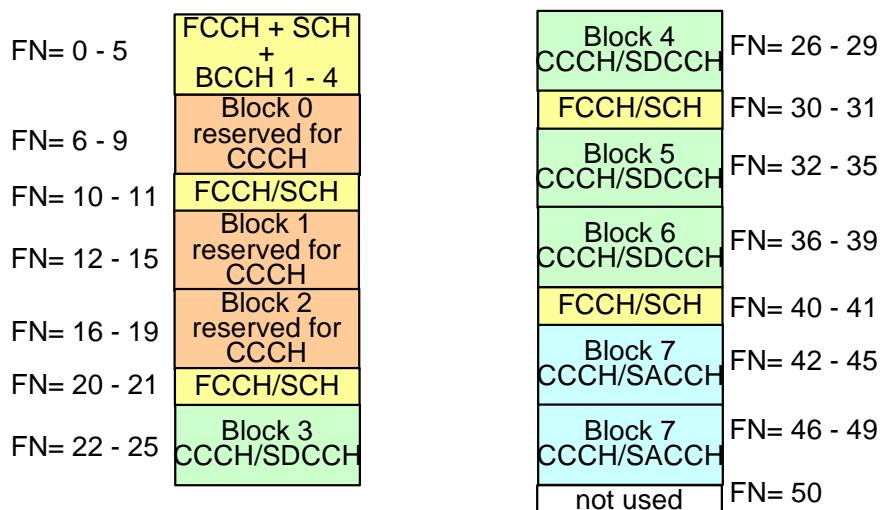

CBCH and CCCH

- CBCH (Cell Broadcast Channel)
 - transmits cell broadcast messages
- PCH (Paging Channel)
 - carries PAG_REQ message
- AGCH (Access Grant Channel)
 - SDCCCH channel assignment
- RACH (Random Access Channel)
 - communication request from MS to BTS

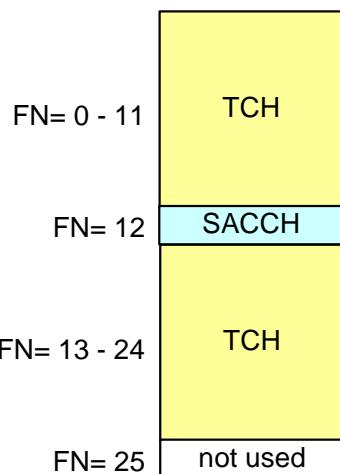

Mapping of Logical Channels

- Each BTS has a particular frequency carrier called BCCH-TRX to transmit BCCH info
- The following channel structure can be found on time slot 0 of carrier BCCH-TRX
 - FCCH
 - SCH
 - BCCH information 1-4
 - Four SDCCH subchannels (optional)
 - CBCH (optional)

Example Mapping of Logical Channels on Time Slot 0 (Downlink)

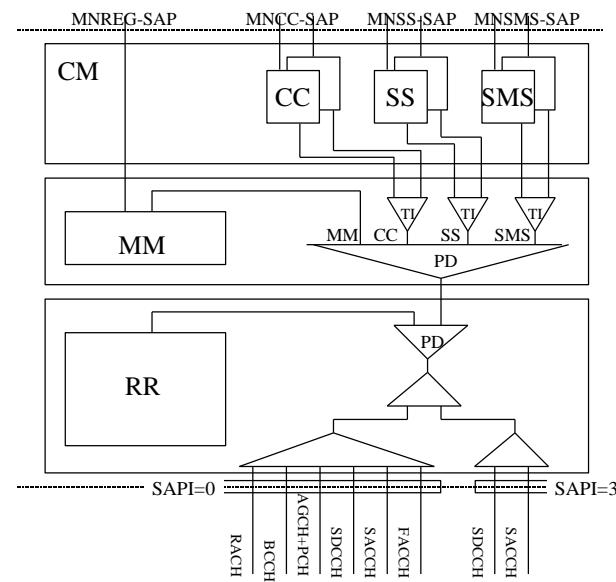

Example Mapping of Logical Channels on Time Slot 2 (Downlink)

GSM Layer 2: LAPDm

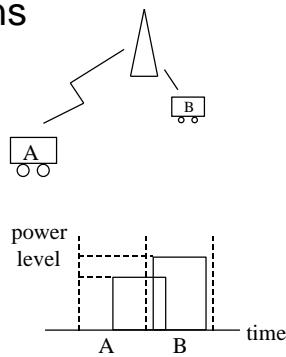

- Functions
 - organization of Layer 3 information into frames
 - peer-to-peer transmission of signaling data in defined frame formats
 - recognition of frame formats
 - establishment, maintenance, and termination of one or more (parallel) data links on signaling channels

Layer 3 Protocol Architecture: Mobile Station Side

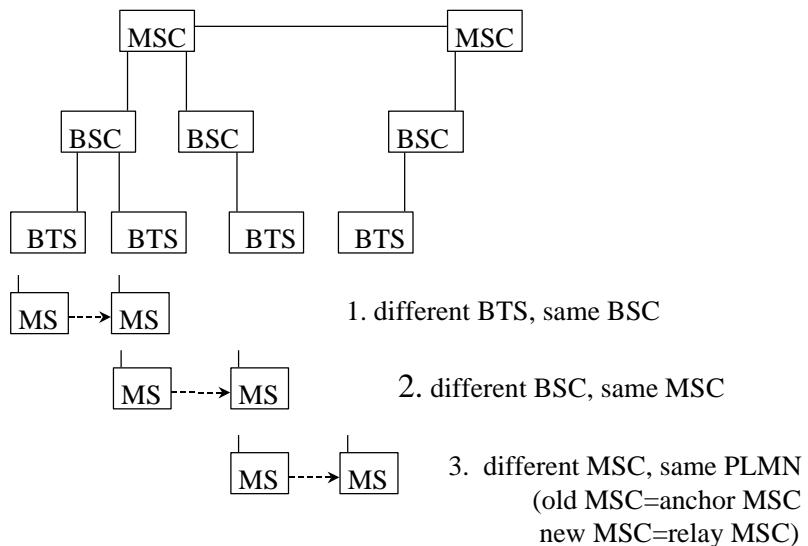

Layer 3 - RR Sublayer

- The RR sublayer handles all the procedures necessary to establish, maintain, and release dedicated radio connections
 - channel allocation
 - handover
 - timing advance
 - power control
 - frequency hopping

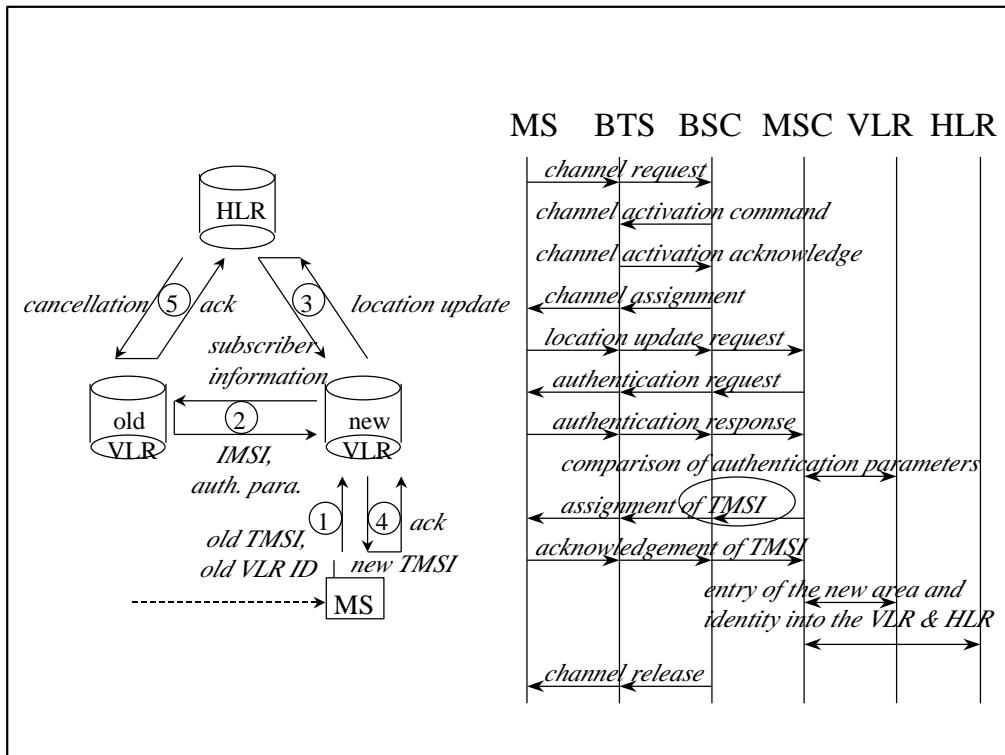

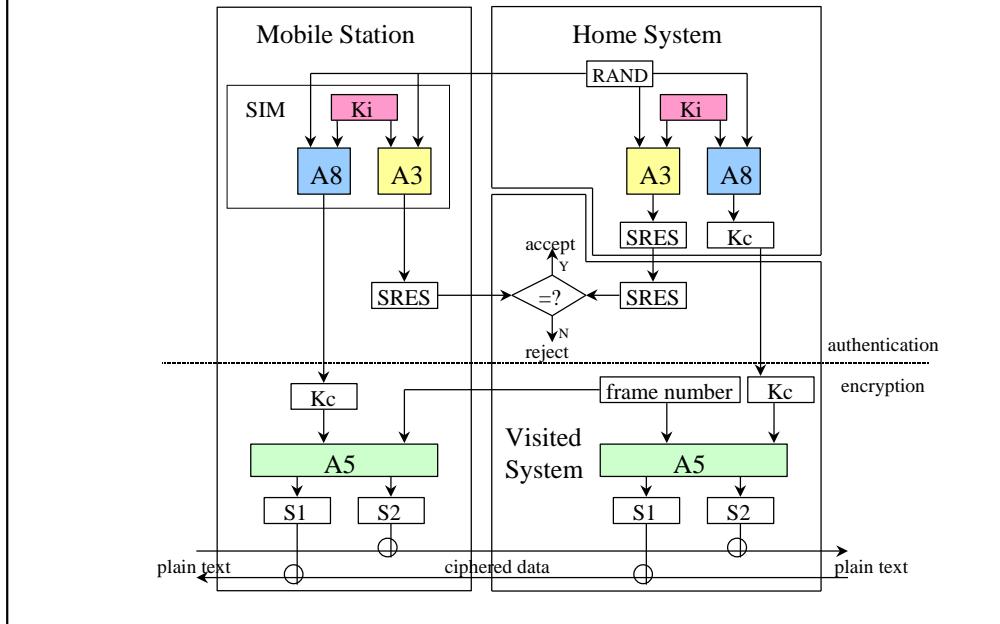

Three Cases of Hand-over

Layer 3 - MM Sublayer

- The MM sublayer copes with all the effects of handling a mobile user that are not directly related to radio functions
 - location area
 - location registration & call delivery
 - location update & paging

Authentication & Encryption/Decryption in GSM

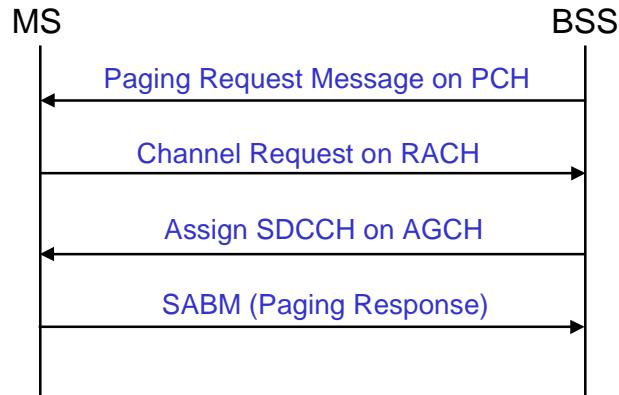

Layer 3 - CM Sublayer

- The CM sublayer manages all the functions necessary for circuit-switched call control
 - call establishment procedures for mobile-originated calls and mobile-terminated calls
 - in-call modification
 - call reestablishment
 - Dual Tone Multi Frequency (DTMF) control procedure for DTMF transmission

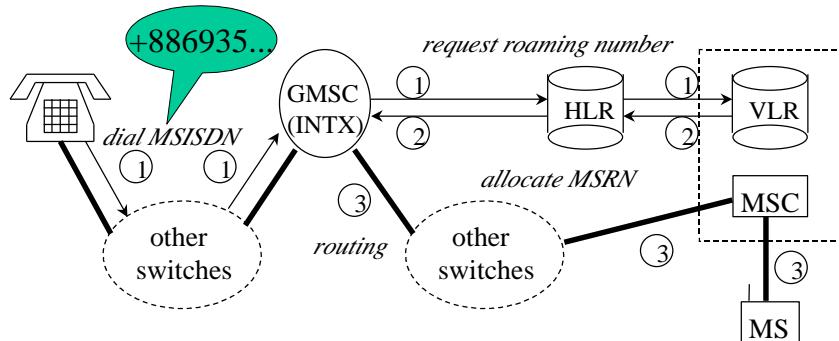

Contents of CM

- Call Control (CC)
- Short Message Service (SMS)
- Supplementary Service (SS)

Paging Procedure

Call Setup Procedure: Mobile Terminated Call

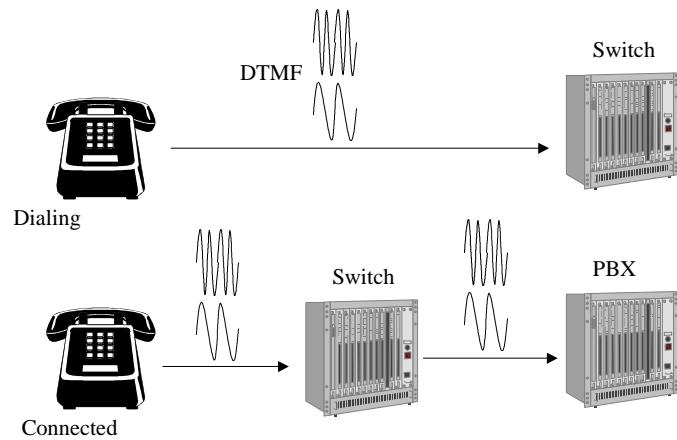

INTerrogating eXchange (INTX)

Mobile Station ISDN Number (MSISDN) (Country Code, see E.164)

Mobile Station Roaming Number (MSRN) (Mobile Country Code, see E.212)

Dual Tone Multiple Frequency (DTMF) in PSTN

DTMF in GSM
